

SAP Network Security Assessment

Review Your SAP Foundation

To understand the security implications of the company's core business application network setup with requirements to connect to cloud services, vendor support accesses, and different data center sites, a review of the network infrastructure of the core business applications is an efficient way to mitigate application security risks by minimizing the attack surface on the network level.

What You Can Expect

The service helps organizations determine threats caused by insecure and vulnerable protocols used across the different SAP systems and applications. We support organizations with the below points:

- Vulnerability scan on a network level
- Identifying internal and external threats that can cause service disruptions
- Identify insecure and vulnerable protocols between applications
- Identify anomalies on a network level
- Provide recommendations for mitigating network threats
- Review and enhance the network design and architecture to comply with the security recommendations provided

As a result of the review, a report is provided describing measures to minimize the attack surface on core business applications and the potential security improvement of the standards in place.

Get in Touch

To improve your security defenses, you must first learn to see your risk and vulnerabilities through the lens of the SAP landscape. We can show you how to do that. Are you ready?
