SAP SDLC Review

Understand Your Software Development Lifecycle

Get in Touch

To improve your security defenses, you must first learn to see your risk and vulnerabilities through the lens of the SAP landscape. We can show you how to do that. Are you ready?

The security of the software delivery pipeline is crucial to the security of core business applications and often ignored by the audit; conducting a review can provide transparency on critical threats. Since SAP is particular about the tools and approaches for development, integration, deployment, common toolchains of DevOps Boilerplates and SSDLC (Secure Software Development life cycle), templates can't be applied without adoption. This can yield to a lack of security governance for software development in the SAP environment.

What You Can Expect

The service will provide a report of the identified gaps, including prioritized recommendations between the organization's secure software development life cycle (SSDLC) standard or Dev(Sec)Ops playbooks and SAP's current SDLC process.

The advisor reviews the customer's software development concept and anticipated developments against the OWASP application security verification Standard (ASVS). The SDLC of the SAP environment is put alongside the determined ASVS security level to identify gaps. To evaluate the SAP SDLC posture, the "as is" and "should" implementation is reviewed throughout an interview. Within a finding workshop, the adviser and customer's SAP development stakeholders align on the identified gaps and recommendations for an efficient improvement.

In a closing workshop, the final report, including executive summary and recommendations, shall be presented to the customer's stakeholders.
